

I used the "time" command inside Makefile.p2 (run using `make -f Makefile.p2`) to compile the code, run both programs, and then output the runtime. Then I just copied it into a .tex and converted to .pdf.

Timing the C code:

0.25s user (CPU)
0.27 elapsed (stopwatch)

Timing the Python code:

5.63s user (CPU)
3.98 elapsed (stopwatch)

To no surprise, C is significantly faster than Python. The Python code is slightly easier to read but both programs are so short it's easy to follow the execution order of each. I think it's a little more difficult for the C code since all the variables are pre-defined so I had to look back a few times; whereas the Python code defines the variable around the same time and uses them.

Given that it only had to run once, I would choose Python because it's easier; but if it needed to be run 10,000 times, I would probably write it in C.
